AB:

Neils report on
voice mod. for TA-1.

I believe we are supposed
(per proj. init chd) to
report on the feasibility
of the mod. before continuing
Proj. ch.

25X1

General: TA-1 Transmitter
 Specific: Modulator (Project 2515)

INTRODUCTION:

The TA-1 Transmitter was designed to be [redacted]
 [redacted] used with any receiver, the TA-1 and receiver comprising a complete radio station. The receiver supplies power to the TA-1 and the final audio tube in the receiver is extracted and inserted into the TA-1. This tube becomes the transmitter. Built into the transmitter case is a transistorized oscillator that can serve as a bfo in receivers lacking such a stage. In its present form, the TA-1 can only be used [redacted].

25X1
25X1MISSION ASSIGNMENT:

External Projects Section requested that an attempt be made to design a modulator for the TA-1. EP placed no restrictions on the size of the modulator and did not specify that it should be either an integral part of the transmitter or a separate unit.

DISCUSSION:

The modulator for the unit may be made an integral part of the transmitter by eliminating the modulation transformer normally used, and by keeping the number of components to a minimum. The hand key and bfo circuitry would have to be removed to make room for these new products.

Figure 1 in the appendix shows the circuit developed. This circuit performed satisfactorily but has one serious fault. If the transmitter tube is removed or the filament opens, the transistor (953) might be damaged due to the increase in collector voltage.

The modulator may be made as a separate unit. The circuit shown in Figure 2 should modulate the transmitter 60 to 75 percent. Two power cables would be necessary. One cable would be used for [redacted] and the other cable for phone operation. Modifications on TA-1 transmitters now in the field could be made without any difficulty. A separate modulator unit would not appreciably increase the weight or size of the completed unit.

CONCLUSION:

The more satisfactory way to modulate the transmitter is to create a separate modulator unit. A separate unit creates no hazard to the final transistor; its installation is simple enough so that a field station could adapt it to existing TA-1 transmitters.
